Homework Assignment

 $\mathbf{2}$

Due Date: October 20th, 2022

CS425 - Database Organization

Name

Instructions

- Try to answer all the questions using what you have learned in class
- When writing a query, write the query in a way that it would work over all possible database instances and not just for the given example instance!
- Some questions are marked as bonus. You do not have to answer these questions to get full points for the assignment. However, you can get bonus points for these questions!
- Please submit the homework electronically using blackboard
- The due date is 10/20!

Consider the following database schema and example instance storing information about theatre plays: play

		pray

- All the attributes that have integer values are of type INT; numbers with decimal point are of type NUMERIC; the attribute *written*, *born*, and *pdate* attributes are of type DATE; others are of type VARCHAR.
- Attributes with black background form the primary key of an relation.
- The attributes *play* and *written* of relations *authorship*, *character*, *scene*, and *performance* are foreign keys to relation *play*.
- The attributes *play*, *written*, *pdate*, and *theatre* of relation *performs* is a foreign key to relation *performance*, *play*, *written*, *character* are a foreign key to relation *character*, and *actor* is a foreign key to relation *actor*.
- The attribute *writer* of relation *authorship* is a foreign key to relation *writer*.

Part 2.1 SQL DDL (Total: 14 Points)

Question 2.1.1 (7 Points)

Write an SQL statement that adds a *length* attribute to relation *play* which stores the length in minutes of the play and adds length to the primary key for this table. Furthermore, enforce that the length of any play is always positive. The default value for length should be 60 minutes.

Question 2.1.2 (7 Points)

Write an SQL statement that adds a constraint to the *performance* relation to make sure that the *pdate* attribute cannot be NULL, and that the value of this attribute is larger than 2022-01-01. Furthermore, the default value for this attribute should be the current date. Use CURRENT_DATE to access the current date.

Part 2.2 SQL Queries (Total: 56 + 10 BONUS Points)

Question 2.2.1 (5 Points)

Write an SQL query that returns the title and written date of play which are performed at least 100 years after they where written. Do not return duplicates.

Question 2.2.2 (5 Points)

Write an SQL query that returns for each play and character in that play, the number of actors (do not double count actors which have played a character more than once) which have played that character.

Question 2.2.3 (7 Points)

Write an SQL query that returns actors and the atre pairs (A, T) if actor A has played in at least half of all the performances at theatre T.

Question 2.2.4 (7 Points)

Write an SQL query that returns for each writer the number of actors that have never played a character from any of the plays of the writer.

Question 2.2.5 (8 Points)

Write an SQL query that returns the name of writers that have only written plays with more than 10 scenes.

Question 2.2.6 (8 Points)

Write an SQL query that returns a rolling sum over the years of the number of plays that have been written up to that point in time. For instance for year 1623, when Macbeth was written you need to return the number of plays that have been written up to and including this year. Note that you can use EXTRACT(YEAR FROM x) to extract the year from a date.

Question 2.2.7 (8 Points)

Write an SQL query that returns the title of the play with the most scenes.

Question 2.2.8 (8 Points)

Write an SQL query that returns names of actors which played in a play written by a writer that was born more than 200 years before the actor was born.

Question 2.2.9 BONUS (5 Points)

Write an SQL query which returns for each genre (that occurs in table play), the first play that was written belonging to this genre. For instance, in our example database the first comedy is "A Midsummer Night's Dream".

Question 2.2.10 BONUS (5 Points)

Write an SQL query that returns the title of plays that have more scenes than characters.

Part 2.3 SQL Updates (Total: 30 + 5 BONUS Points)

Question 2.3.1 (7 Points)

Delete all characters of plays that were written by writers born before year 1000.

Question 2.3.2 (8 Points)

Add a new character *King Kong* to play *Looking Back in Anger* and add a performance by actor *John Malkovich* for this role to the 2022-11-15 performance at *Steppenwolf Theatre* of this play.

Question 2.3.3 (6 Points)

Actor John Malkovitch refuses to play *King Kong* in the newly inserted 2022-11-15 performance of *Look Back* in Anger. Change this performance to actor "Frances McDormand".

Question 2.3.4 (9 Points)

Update the performance table such that all performances from *Steppenwolf Theatre* are moved to *Navy Pier* and all performance from *Navy Pier* are moved to *Theatre in the Park*. Note that we expect you to write a single statement that implements this.

Question 2.3.5 BONUS (5 Points)

Update the pdate by delaying it by one week (7 days) for all performances of plays written by *William Shakespeare*. Note that Postgres has an interval data type that can be used for arithmetic over dates, e.g., $'2015-01-01::DATE_{\Box}+_{\Box}'1$ day'::interval evaluates to 2015-01-02.
