Cleaning Methods

 Enforce Standards
 Applied in real world
 How to develop a standard not a fit for this lecture
 Still relies on no human errors

 Constraint-based cleaning
 Define constraints for data
 "Make" data fit the constraints

 Statistical techniques
 Find outliers and smoothen or remove
 E.g., use a clustering algorithm

5

Constraint Languages
 First work focused on functional dependencies (FDs)
 Extensions of FDs have been proposed to allow rules that cannot be expressed with FDs

 E.g., conditional FDs only enforce the FD is a condition is met
 -> finer grained control, e.g., zip -> city only if country is US

 Constraints that consider master data

 Master data is highly reliable data such as a government issued zip, city lookup table

• Denial constraints

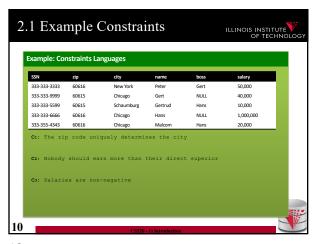

- Generalize most other proposed constraints

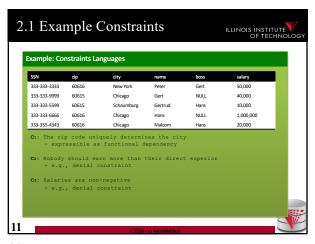

- State what should not be true

- Negated conjunction of relational and comparison atoms $\forall \vec{x} : \neg(\phi(\vec{x}))$ • Here we will look at FDs mainly and a bit at denial constraints

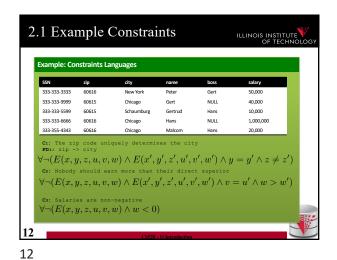

- Sometimes use logic based notation introduced previously

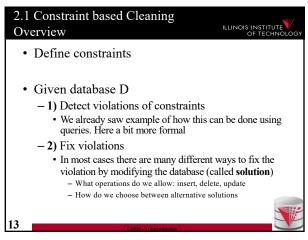

8

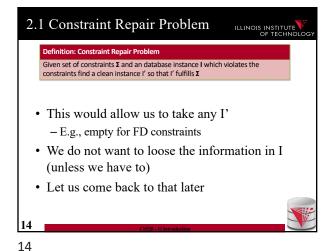

11

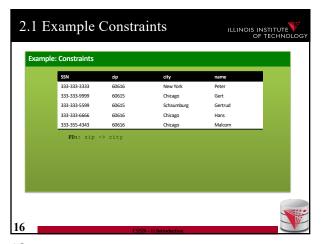

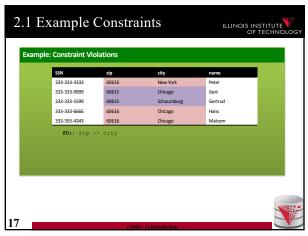

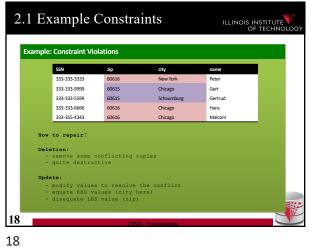

Overview
 Study 1) + 2) for FDs

 Given database D
 -1) Detect violations of constraints
 • We already saw example of how this can be done using queries. Here a bit more formal
 -2) Fix violations
 • In most cases there are many different ways to fix the violation by modifying the database (called solution)
 - What operations do we allow: insert, delete, update
 - How do we choose between alternative solutions

2.1 Constraint based Cleaning
Overview

• How to repair?

• Deletion:

- remove some conflicting tuples

- quite destructive

• Update:

- modify values to resolve the conflict

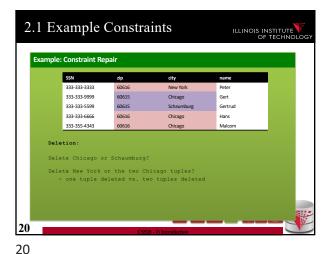

- equate RHS values (city here)

- disequate LHS value (zip)

• Insertion?

- Not for FDs, but e.g., FKs

19

Example: Constraint Repair

SSN ip dty name
333-333-3333 60516 New York Peter
333-333-5999 60515 Chicago Gert d
333-335-599 60615 Chicago Hans
333-335-666 60516 Chicago Hans
333-335-4343 60616 Chicago Malcom

Update equate RHS:

Update Chicago->Schaumburg or Schaumburg->Chicago

Update New York->Chicago or Chicago->Hew York
- one tuple deleted vs. two cells updated

Update disequate LHS:

Which tuple to update?
What value do we use here? How to avoid creating other conflicts?

21

	Constraint based Cleaning erview ILLINOIS INSTITUTE OF TECHNOLOGY
•	Principle of minimality
	 Choose repair that minimally modifies database Motivation: consider the solution that deletes every tuple
•	Most update approaches equate RHS because there is usually no good way to choose LHS values unless we have master data
22	- E.g., update zip to 56423 or 52456 or 22322
22	

• Given FD A -> B on R(A,B)

- Recall logical representation

- Forall X, X': R(X,Y) and R(X',Y') and X=X' -> Y=Y'

- Only violated if we find two tuples where A=A', but B

!= B'

- In datalog

• Q(): R(X,Y), R(X',Y'), X=X', Y!=Y'

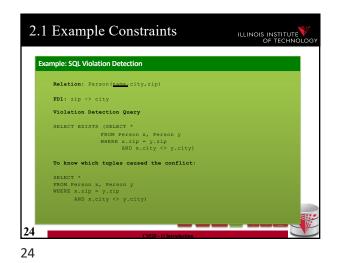

- In SQL

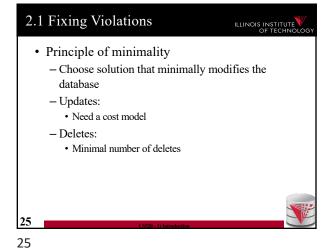

SELECT EXISTS (SELECT *

FROM R x, R y

WHERE x.A=y.A AND x.B<>y.B)

23

2.1 Constraint Repair Problem

Definition: Constraint Repair Problem (restated)

Given set of constraints Σ and a database instance I which violates the constraints find a clean instance I' (does not violate the constraints) with cost(I,I') being minimal

• Cost metrics that have been used

- Deletion + Insertion $\Delta(I, I') = (I - I') \cup (I' - I)$ • S-repair: minimize measure above under set inclusion

• C-repair: minimize cardinality

- Update

• Assume distance metric d for attribute values

2.1 Cost Metrics

• Deletion + Insertion $\Delta(I,I') = (I-I') \cup (I'-I)$ • S-repair: minimize measure above under set inclusion
• C-repair: minimize cardinality

• Update

• Assume single relation R with uniquely identified tuples
• Assume distance metric d for attribute values
• Schema(R) = attributes in schema of relation R
• t' is updated version of tuple t
• Minimize: $\sum_{t \in R} \sum_{A \in Schema(R)} d(t.A, t'.A)$

• Update

• Assume single relation R with uniquely identified tuples

• Assume distance metric d for attribute values

• Schema(R) = attributes in schema of relation R

• t' is updated version of tuple t

• Minimize: $\sum_{t \in R} \sum_{A \in Schema(R)} d(t.A, t'.A)$ • We focus on this one

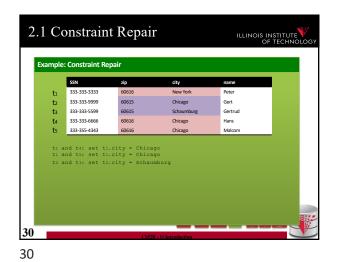

• This is NP-hard

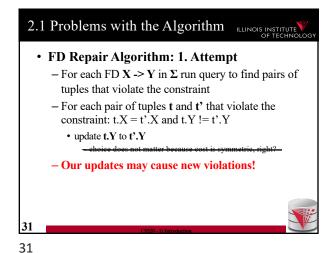

— Heuristic algorithm

Post Pharms of the constraint
 For each FD X -> Y in Σ run query to find pairs of tuples that violate the constraint
 For each pair of tuples t and t' that violate the constraint
 update t.Y to t'.Y
 choice does not matter because cost is symmetric, right?

29

27

FD Repair Algorithm: 2. Attempt

- I' = I

- 1) For each FD X -> Y in Σ run query to find pairs of tuples that violate the constraint

- 2) For each pair of tuples t and t' that violate the constraint: t.X = t'.X and t.Y! = t'.Y

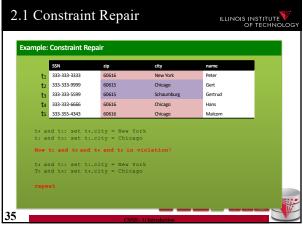

• update t.Y to t'.Y

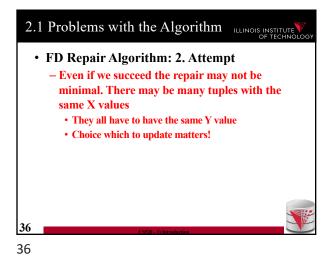

- choice does not matter because cost is symmetric, right?

- 3) If we changed I' goto 1)

FD Repair Algorithm: 2. Attempt

 I' = I
 1) For each FD X -> Y in Σ run query to find pairs of tuples that violate the constraint
 2) For each pair of tuples t and t' that violate the constraint: t.X = t'.X and t.Y! = t'.Y
 update t.Y to t'.Y
 ehoise does not matter because cost is symmetric, right?
 3) If we changed I' goto 1)
 May never terminate

2.1 Problems with the Algorithm ILLINOIS INSTITUTE OF TECHNOL • FD Repair Algorithm: 3. Attempt - Equivalence Classes · Keep track of sets of cells (tuple,attribute) that have to have the same values in the end (e.g., all Y attribute values for tuples with same X attribute value) • These classes are updated when we make a choice · Choose Y value for equivalence class using minimality, e.g., most common value

- Observation • Equivalence Classes may merge, but never split if we only update RHS of all tuples with same X at once • -> we can find an algorithm that terminates

38

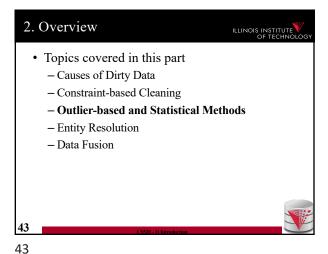

2.1 Problems with the Algorithm ILLINOIS INSTITUTE OF TECHNOL • FD Repair Algorithm: 3. Attempt - Initialize: · Each cell in its own equivalence class • Put all cells in collection unresolved - While **unresolved** is not empty • Remove tuple t from unresolved • Pick FD X->Y (e.g., random) • Compute set of tuples S that have same value in X · Merge all equivalence classes for all tuples in S and attributes in Y • Pick values for Y (update all tuples in S to Y) 39

2.1 Problems with the Algorithm ILLINOIS INSTITUTE • FD Repair Algorithm: 3. Attempt • Algorithm using this idea: - More heuristics to improve quality and performance · Cost-based pick of next EQ's to merge - Also for FKs (Inclusion Constraints) A Cost-Based Model and Effective Heuristic for Repairing Constraints by Value Modification

2.1 Consistent Query Answering ILLINOIS INSTITUTE As an alternative to fixing the database which requires making a choice we could also leave it dirty and try to resolve conflicts at query time - Have to reason over answers to the query without knowing which of the possible repairs will be chosen - Intuition: return tuples that would be in the query result for every possible repair

41

2.2 Statistical and Outlier ILLINOIS INSTITUTE • Assumption - Errors can be identified as outliers · How do we find outliers? - Similarity-based: • Object is dissimilar to all (many) other objects • E.g., clustering, objects not in cluster are outliers - Some type of statistical test: • Given a distribution (e.g., fitted to the data) • How probable is it that the point has this value? • If low probability -> outlier

44

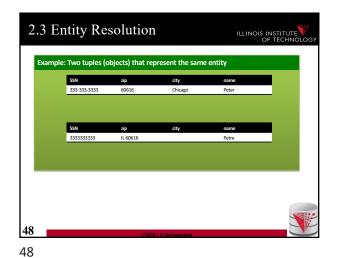

46

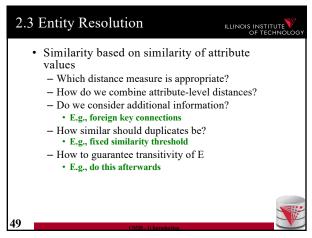

2. Overview ILLINOIS INSTITUTE • Topics covered in this part - Causes of Dirty Data - Constraint-based Cleaning - Outlier-based and Statistical Methods - Entity Resolution - Data Fusion

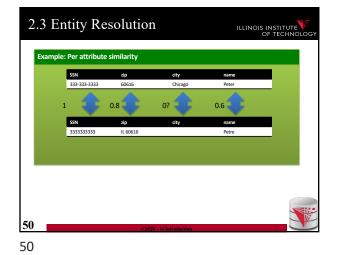

2.3 Entity Resolution ILLINOIS INSTITUTE • Entity Resolution (ER) • Alternative names - Duplicate detection - Record linkage - Reference reconciliation - Entity matching **–** ...

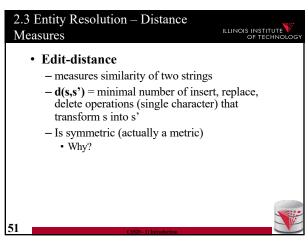

2.3 Entity Resolution ILLINOIS INSTITUTE Given sets of tuples A compute equivalence relation E(t,t') which denotes that tuple t and t' represent the same entity. Intuitively, E should be based on how similar t and t' are - Similarity measure? • E should be an equivalence relation - If t is the same as t' and t' is the same as t" then t should be the same as t"

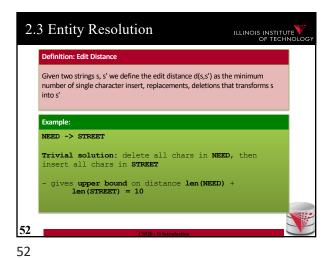

47

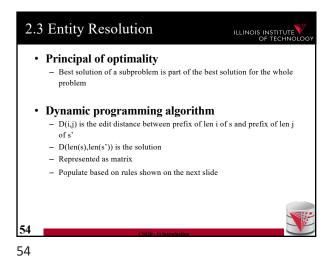

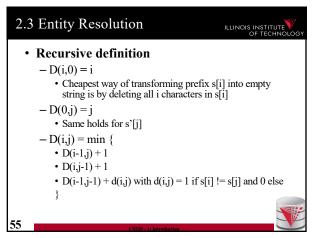

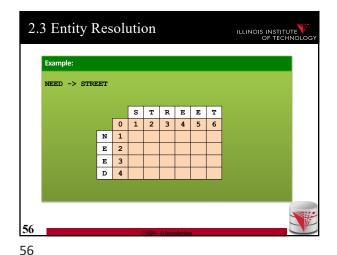

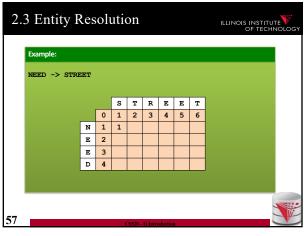

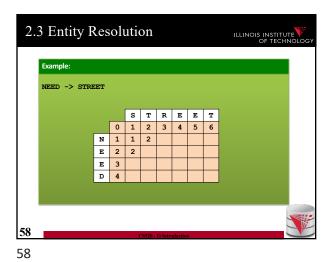

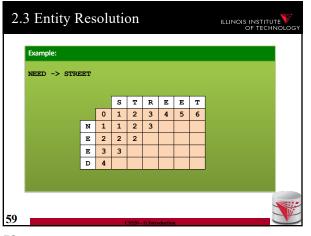

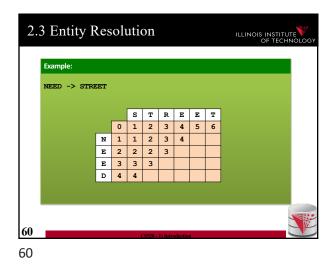

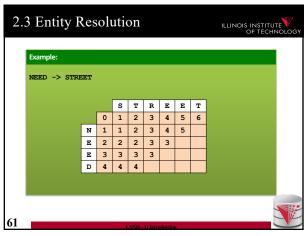

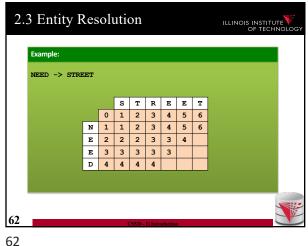

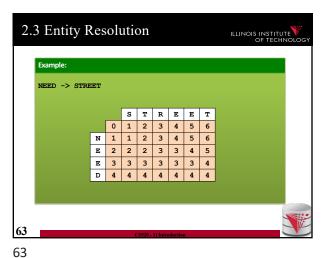

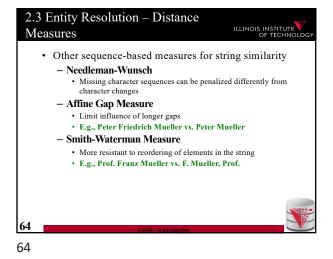

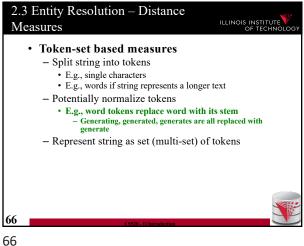

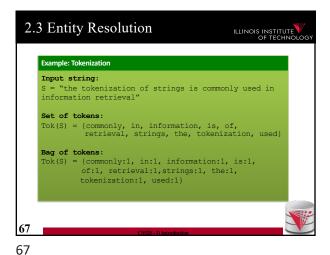

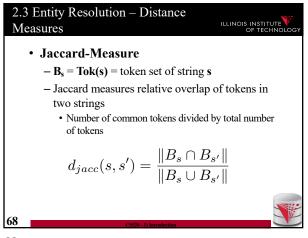

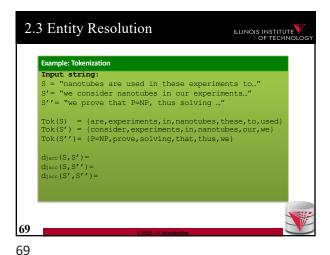

2.3 Entity Resolution – Distance ILLINOIS INSTITUTE Measures · Other sequence-based measures for string similarity - Jaro-Winkler · Consider shared prefixes · Consider distance of same characters in strings • E.g., johann vs. ojhann vs. ohannj - See textbook for details!

65

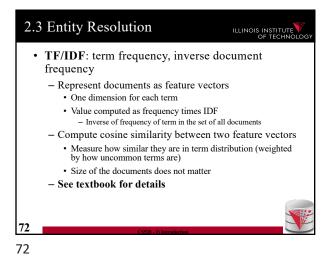

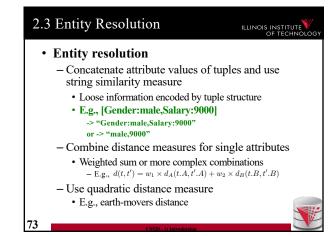

2.3 Entity Resolution ILLINOIS INSTITUTE Input string: "nanotubes are used in these experiments to..." S' = "we consider nanotubes in our experiments..." S'' = "we prove that P=NP, thus solving ..."
$$\label{eq:total_constraint} \begin{split} & \text{Tok}(S) &= \{\text{are,experiments,in,nanotubes,these,to,used}\} \\ & \text{Tok}(S') &= \{\text{consider,experiments,in,nanotubes,our,we}\} \\ & \text{Tok}(S'') &= \{P=NP,\text{prove,solving,that,thus,we}\} \end{split}$$
70

2.3 Entity Resolution ILLINOIS INSTITUTE Other set-based measures - TF/IDF: term frequency, inverse document frequency • Take into account that certain tokens are more common • If two strings (called documents for TF/IDF) overlap on uncommon terms they are more likely to be similar than if they overlap on common terms - E.g., the vs. carbon nanotube structure

Entity resolution
 Rule-based approach
 Set of if this than that rules
 Learning-based approaches
 Clustering-based approaches
 Probabilistic approaches to matching
 Collective matching

74

• Weighted linear combination

- Say tuples have \mathbf{n} attributes

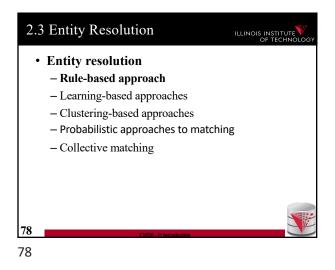

- \mathbf{w}_i : predetermined weight of an attribute

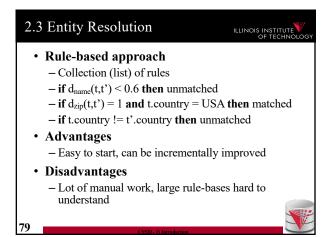

- $\mathbf{d}_i(\mathbf{t}, \mathbf{t}')$: similarity measure for the \mathbf{i}^{th} attribute $d(t, t') = \sum_{i=0}^n w_i \times d_i(t, t')$ • Tuples match if $\mathbf{d}(\mathbf{t}, \mathbf{t}') > \beta$ for a threshold β

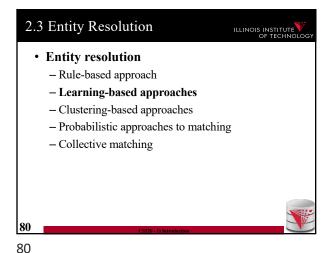

Weighted linear combination
 How to determine weights?
 E.g., have labeled training data and use ML to learn weights
 Use non-linear function?

77

73

Learning-based approach
 Build all pairs (t,t') for training dataset
 Represent each pair as feature vector from, e.g., similarities
 Train classifier to return {match,no match}

 Advantages
 automated

 Disadvantages
 Requires training data

Entity resolution
 Rule-based approach
 Learning-based approaches
 Clustering-based approaches
 Probabilistic approaches to matching
 Collective matching

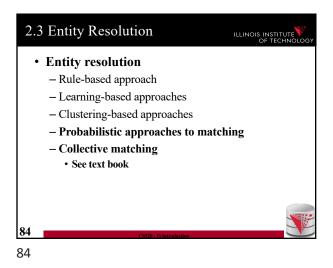

Clustering-based approach
 Apply clustering method to group inputs
 Typically hierarchical clustering method
 Clusters now represent entities
 Decide how to merge based on similarity between clusters

 Advantages
 Automated, no training data required

 Disadvantages
 Choice of cluster similarity critical

83

79

Data Fusion = how to combine (possibly conflicting) information from multiple objects representing the same entity
 Choose among conflicting values
 If one value is missing (NULL) choose the other one
 Numerical data: e.g., median, average
 Consider sources: have more trust in certain data sources
 Consider value frequency: take most frequent value
 Timeliness: latest value
