### Shortest Paths I

- Properties of shortest paths
- Dijkstra's algorithm
- Correctness
- Analysis
- Breadth-first search

**Prof. Charles E. Leiserson**

# Paths in graphs

Consider a digraph  $G = (V, E)$  with edge-weight function  $w : E \rightarrow \mathbb{R}$ . The **weight** of path  $p = v_1 \rightarrow v_2 \rightarrow \cdots \rightarrow v_k$  is defined to be

$$w(p) = \sum_{i=1}^{k-1} w(v_i, v_{i+1}).$$

# Paths in graphs

Consider a digraph  $G = (V, E)$  with edge-weight function  $w : E \rightarrow \mathbb{R}$ . The **weight** of path  $p = v_1 \rightarrow v_2 \rightarrow \dots \rightarrow v_k$  is defined to be

$$w(p) = \sum_{i=1}^{k-1} w(v_i, v_{i+1}).$$

**Example:**

# Shortest paths

A *shortest path* from  $u$  to  $v$  is a path of minimum weight from  $u$  to  $v$ . The *shortest-path weight* from  $u$  to  $v$  is defined as

$$\delta(u, v) = \min\{w(p) : p \text{ is a path from } u \text{ to } v\}.$$

**Note:**  $\delta(u, v) = \infty$  if no path from  $u$  to  $v$  exists.

# Optimal substructure

**Theorem.** A subpath of a shortest path is a shortest path.

# Optimal substructure

**Theorem.** A subpath of a shortest path is a shortest path.

*Proof.* Cut and paste:

# Optimal substructure

**Theorem.** A subpath of a shortest path is a shortest path.

*Proof.* Cut and paste:

# Triangle inequality

**Theorem.** For all  $u, v, x \in V$ , we have  
$$\delta(u, v) \leq \delta(u, x) + \delta(x, v).$$

# Triangle inequality

**Theorem.** For all  $u, v, x \in V$ , we have  
$$\delta(u, v) \leq \delta(u, x) + \delta(x, v).$$

*Proof.*

# Well-definedness of shortest paths

If a graph  $G$  contains a negative-weight cycle, then some shortest paths may not exist.

# Well-definedness of shortest paths

If a graph  $G$  contains a negative-weight cycle, then some shortest paths may not exist.

**Example:**

# Single-source shortest paths

**Problem.** From a given source vertex  $s \in V$ , find the shortest-path weights  $\delta(s, v)$  for all  $v \in V$ .

If all edge weights  $w(u, v)$  are *nonnegative*, all shortest-path weights must exist.

**IDEA:** Greedy.

1. Maintain a set  $S$  of vertices whose shortest-path distances from  $s$  are known.
2. At each step add to  $S$  the vertex  $v \in V - S$  whose distance estimate from  $s$  is minimal.
3. Update the distance estimates of vertices adjacent to  $v$ .

# Dijkstra's algorithm

$d[s] \leftarrow 0$

**for** each  $v \in V - \{s\}$

**do**  $d[v] \leftarrow \infty$

$S \leftarrow \emptyset$

$Q \leftarrow V$

$\triangleleft Q$  is a priority queue maintaining  $V - S$

# Dijkstra's algorithm

$d[s] \leftarrow 0$

**for** each  $v \in V - \{s\}$

**do**  $d[v] \leftarrow \infty$

$S \leftarrow \emptyset$

$Q \leftarrow V$       $\triangleleft Q$  is a priority queue maintaining  $V - S$

**while**  $Q \neq \emptyset$

**do**  $u \leftarrow \text{EXTRACT-MIN}(Q)$

$S \leftarrow S \cup \{u\}$

**for** each  $v \in \text{Adj}[u]$

**do if**  $d[v] > d[u] + w(u, v)$

**then**  $d[v] \leftarrow d[u] + w(u, v)$

# Dijkstra's algorithm

$d[s] \leftarrow 0$

**for** each  $v \in V - \{s\}$

**do**  $d[v] \leftarrow \infty$

$S \leftarrow \emptyset$

$Q \leftarrow V$       $\triangleleft Q$  is a priority queue maintaining  $V - S$

**while**  $Q \neq \emptyset$

**do**  $u \leftarrow \text{EXTRACT-MIN}(Q)$

$S \leftarrow S \cup \{u\}$

**for** each  $v \in \text{Adj}[u]$

**do** **if**  $d[v] > d[u] + w(u, v)$      *relaxation*  
          **then**  $d[v] \leftarrow d[u] + w(u, v)$      *step*

Implicit **DECREASE-KEY**

# Correctness — Part I

**Lemma.** Initializing  $d[s] \leftarrow 0$  and  $d[v] \leftarrow \infty$  for all  $v \in V - \{s\}$  establishes  $d[v] \geq \delta(s, v)$  for all  $v \in V$ , and this invariant is maintained over any sequence of relaxation steps.

# Correctness — Part I

**Lemma.** Initializing  $d[s] \leftarrow 0$  and  $d[v] \leftarrow \infty$  for all  $v \in V - \{s\}$  establishes  $d[v] \geq \delta(s, v)$  for all  $v \in V$ , and this invariant is maintained over any sequence of relaxation steps.

**Proof.** Suppose not. Let  $v$  be the first vertex for which  $d[v] < \delta(s, v)$ , and let  $u$  be the vertex that caused  $d[v]$  to change:  $d[v] = d[u] + w(u, v)$ . Then,

$$\begin{array}{ll} d[v] < \delta(s, v) & \text{supposition} \\ \leq \delta(s, u) + \delta(u, v) & \text{triangle inequality} \\ \leq \delta(s, u) + w(u, v) & \text{sh. path} \leq \text{specific path} \\ \leq d[u] + w(u, v) & v \text{ is first violation} \end{array}$$

Contradiction. □

# Correctness — Part II

**Lemma.** Let  $u$  be  $v$ 's predecessor on a shortest path from  $s$  to  $v$ . Then, if  $d[u] = \delta(s, u)$  and edge  $(u, v)$  is relaxed, we have  $d[v] = \delta(s, v)$  after the relaxation.

## Correctness — Part II

**Lemma.** Let  $u$  be  $v$ 's predecessor on a shortest path from  $s$  to  $v$ . Then, if  $d[u] = \delta(s, u)$  and edge  $(u, v)$  is relaxed, we have  $d[v] = \delta(s, v)$  after the relaxation.

*Proof.* Observe that  $\delta(s, v) = \delta(s, u) + w(u, v)$ . Suppose that  $d[v] > \delta(s, v)$  before the relaxation. (Otherwise, we're done.) Then, the test  $d[v] > d[u] + w(u, v)$  succeeds, because  $d[v] > \delta(s, v) = \delta(s, u) + w(u, v) = d[u] + w(u, v)$ , and the algorithm sets  $d[v] = d[u] + w(u, v) = \delta(s, v)$ . □

# Correctness — Part III

**Theorem.** Dijkstra's algorithm terminates with  $d[v] = \delta(s, v)$  for all  $v \in V$ .

# Correctness — Part III

**Theorem.** Dijkstra's algorithm terminates with  $d[v] = \delta(s, v)$  for all  $v \in V$ .

*Proof.* It suffices to show that  $d[v] = \delta(s, v)$  for every  $v \in V$  when  $v$  is added to  $S$ . Suppose  $u$  is the first vertex added to  $S$  for which  $d[u] > \delta(s, u)$ . Let  $y$  be the first vertex in  $V - S$  along a shortest path from  $s$  to  $u$ , and let  $x$  be its predecessor:

# Correctness — Part III (continued)

Since  $u$  is the first vertex violating the claimed invariant, we have  $d[x] = \delta(s, x)$ . When  $x$  was added to  $S$ , the edge  $(x, y)$  was relaxed, which implies that  $d[y] = \delta(s, y) \leq \delta(s, u) < d[u]$ . But,  $d[u] \leq d[y]$  by our choice of  $u$ . Contradiction.  $\square$

# Example of breadth-first search

$Q: a b d c e g i f h$

# Correctness of BFS

```
while  $Q \neq \emptyset$ 
do  $u \leftarrow \text{DEQUEUE}(Q)$ 
  for each  $v \in \text{Adj}[u]$ 
  do if  $d[v] = \infty$ 
    then  $d[v] \leftarrow d[u] + 1$ 
      ENQUEUE( $Q, v$ )
```

## Key idea:

The FIFO  $Q$  in breadth-first search mimics the priority queue  $Q$  in Dijkstra.

- **Invariant:**  $v$  comes after  $u$  in  $Q$  implies that  $d[v] = d[u]$  or  $d[v] = d[u] + 1$ .
